BOARD ROUTING RECOMMENDATIONS

1.0 SCOPE

This specification covers the high-speed PCB routing recommendations of high-speed signals for 12Gbps application at primary and secondary ports for 78844 series connector. The connector is a right angle surface mount type. The pins of the connector are soldered for mechanical retention to the PC board.

DISCLAIMER: Molex does not guarantee the performance of the final product to match the information provided in this document. All information in this report is considered proprietary, confidential and the property of Molex. This guide is not intended as a substitute for engineering analysis.

2.0 PC BOARD REQUIREMENTS

2.1 MATERIAL THICKNESS

The recommended PC board thickness shall be 2.36mm. Suitable PC board material shall be glass epoxy (FR-4).

2.2 LAYOUT

The solder pads for the connector assembly must be precisely located to ensure proper placement and optimum performance of the connector assembly. Refer to the applicable Sales Drawing for the recommended solder pad pattern, dimensions and tolerances.

BOARD ROUTING RECOMMENDATIONS

3.3 HIGH-SPEED REFERENCE PLANE ANTI-PAD

Layer 2 Ground Plane (Beneath Connector Footprint)

All Other Ground Planes

Note: Anti-pad was implemented for impedance matching. Dimensions can vary from recommendation to meet electrical requirements. The anti-pad can be made larger with a broader keep-out region on non-signal ground planes to minimize parasitic capacitance.

BOARD ROUTING RECOMMENDATIONS

3.4 TRACE TO PAD ATTACHMENT (FOR BOTH MICROSTRIP AND STRIPLINE ROUTING)

There are several ways to connect the traces to their corresponding signal pads. Two possible methods are illustrated in Figures 1 and 2.

rigure

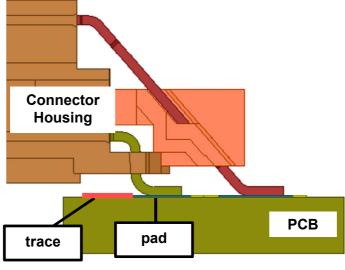

Figure 2

As seen in Figure 1, trace routed outwards from pad of connector will result in minimum pad stub while worst case pad stub occurs when trace is routed inwards as shown in Figure 2.

BOARD ROUTING RECOMMENDATIONS

3.5 GROUND VIA PLACEMENT

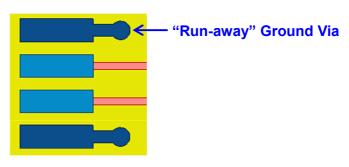

Figure 3

As seen in Figure 3, "run-away" ground vias from ground pads should follow the direction where the signal traces were attached to their corresponding signal pads.

BOARD ROUTING RECOMMENDATIONS

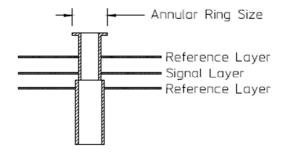

3.6 SIGNAL THROUGH-HOLE VIA STUBS (FOR STRIPLINE ROUTING)

Bottom Launch Driven Via (Preferred) Top Launch
Stub Via
(Worst Case)

Standard Via Configuration

Back Drill To Minimize Stub

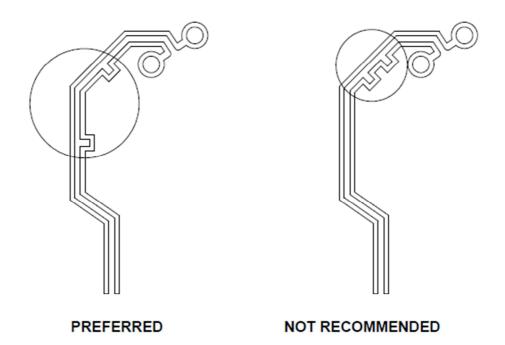

Only the signal reference ground planes are shown above and only two annular rings are required for retention of the through-hole via within the printed circuit board. Non-functional annular rings should be removed for unassociated signal layers.

BOARD ROUTING RECOMMENDATIONS

3.7 SKEW COMPENSATION FOR DIFFERENTIAL ROUTING

It is recommended that skew compensation be distributed verses grouped in one or more locations.

3.8 TRACE COMPARISON

TRANSITION SHOULD BE SYMMETRIC
