

FEATURES

8.5 GHz to 13.5 GHz frequency range
Conversion loss to 7 dB typical
Image rejection to 22 dBc typical
LO to RF isolation: 38 dB typical
Input IP3: 19 dBm typical
Wide IF frequency range: dc to 3.5 GHz
11-pad bare die (CHIP)

APPLICATIONS

Microwave and very small aperture terminal (VSAT) radios
Test equipment
Military electronic warfare (EW), electronic countermeasure (ECM), and command, control, communications, and intelligence (C3I)

GENERAL DESCRIPTION

The HMC521ACHIPS is a passive, compact, inphase/quadrature (I/Q) monolithic microwave integrated circuit (MMIC) mixer that can be used either as an image reject mixer for receiver operations or as a single sideband upconverter for transmitter operations. With a RF and local oscillator (LO) range of 8.5 GHz to 13.5 GHz, and an intermediate frequency (IFx) bandwidth of dc to 3.5 GHz, the HMC521ACHIPS is ideal for applications requiring excellent RF performance and a simple design with fewer components. A single HMC521ACHIPS can replace multiple narrow-band mixers in a design. The inherent I/Q architecture of the HMC521ACHIPS offers exceptional image rejection and thereby eliminates the need for expensive

FUNCTIONAL BLOCK DIAGRAM

filtering for unwanted sidebands. The mixer also provides high LO to RF isolation (>35 dB) and reduces the effect of LO leakage to ensure signal integrity. Being a passive mixer, the HMC521ACHIPS does not require any dc power sources. The device offers a lower noise figure compared to an active mixer, ensuring outstanding dynamic range for high performance and precision applications. The HMC521ACHIPS is fabricated on a gallium arsenide (GaAs), metal semiconductor field effect transistor (MESFET) process and uses Analog Devices, Inc., mixer cells and a 90° hybrid. The HMC521ACHIPS operates over a -40°C to +85°C temperature range.

10/2019—Revision 0: Initial Version

SPECIFICATIONS

T_A = 25°C, intermediate frequency (IF) = 100 MHz, and LO = 15 dBm on the upper sideband. All measurements performed as a downconverter, with the chip mounted in a 50 Ω test fixture and external hybrid, unless otherwise noted.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
RF Input Power	20 dBm
LO Input Power	27 dBm
IFx Input Power	20 dBm
IFx Source and Sink Current	2 mA
Junction Temperature (T_J)	175°C
Lifetime at Maximum T_J	$>1 \times 10^6$ hours
Continuous Power Dissipation, P_{Diss} ($T_A = 85^\circ\text{C}$, Derates 6.22 mW/ $^\circ\text{C}$ Above 85°C) ¹	608 mW
Temperature Range	
Operating	-40°C to +85°C
Storage	-65°C to +150°C
Lead	-65°C to +150°C
Electrostatic Discharge (ESD) Sensitivity	
Human Body Model (HBM)	250 V
Field Induced Charged Device Model (FICDM)	500 V

¹ P_{Diss} is a theoretical number calculated by $(T_J - 85^\circ\text{C})/\theta_{JC}$.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Careful attention to PCB thermal design is required.

θ_{JC} is the junction to case thermal resistance.

Table 3. Thermal Resistance

Package Type	θ_{JC}	Unit
C-11-2 ¹	148	$^\circ\text{C}/\text{W}$

¹ Test Condition 1: JEDEC Standard JESD51-2.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pad Configuration

Table 4. Pad Function Descriptions

Pad No.	Mnemonic	Description
1, 3, 6, 8, and 9	GND	Grounds. These pads must be connected to RF and dc ground. See Figure 3 for the GND interface schematic.
2	RF	Radio Frequency Port. This pad is ac-coupled and matched to 50 Ω. See Figure 6 for the RF interface schematic.
4, 10	IF1	First Quadrature Intermediate Frequency Ports. These pads are dc-coupled. For applications not requiring operation to dc, dc block these ports externally using a series capacitor of a value chosen to pass the necessary IF frequency range. For operation to dc, these pads must not source or sink more than 2 mA of current. Otherwise, die malfunction or die failure may result. Users can select either of the IF1 pads. However, the unused IF1 pad must be left open. See Figure 5 for the IFx interface schematic.
5, 11	IF2	Second Quadrature Intermediate Frequency Ports. These pads are dc-coupled. For applications not requiring operation to dc, dc block these ports externally using a series capacitor of a value chosen to pass the necessary IF frequency range. For operation to dc, these pads must not source or sink more than 2 mA of current. Otherwise, die malfunction or die failure may result. Users can select either of the IF2 pads. However, the unused IF2 pad must be left open. See Figure 5 for the IFx interface schematic.
7	LO	Local Oscillator Port. This pad is ac-coupled and matched to 50 Ω. See Figure 4 for the LO interface schematic.
Die bottom	GND	Ground. The die bottom must be attached directly to the ground plane eutectically or with conductive epoxy.

THEORY OF OPERATION

The HMC521ACHIPS is a passive, compact, I/Q MMIC mixer that can be used either as an image reject mixer for receiver operations or as a single-sideband upconverter for transmitter operations. With a RF and LO range of 8.5 GHz to 13.5 GHz, and an IF bandwidth of dc to 3.5 GHz, the HMC521ACHIPS is ideal for applications requiring excellent RF performance, and a simple design with fewer components. A single HMC521ACHIPS can replace multiple narrow-band mixers in a design. The inherent I/Q architecture of the HMC521ACHIPS offers exceptional image rejection and thereby eliminates the need for expensive filtering for unwanted sidebands. The mixer also provides high LO to RF isolation (>35 dB) and reduces the effect of LO leakage to ensure signal integrity. Being a passive mixer, the HMC521ACHIPS does not require any dc power sources. The device offers a lower noise figure compared to an

active mixer, ensuring outstanding dynamic range for high performance and precision applications. The HMC521ACHIPS is fabricated on a GaAs, MESFET process and uses Analog Devices mixer cells and a 90° hybrid. The HMC521ACHIPS operates over a -40°C to +85°C temperature range.

The IF1 and IF2 pads of the HMC521ACHIPS can be connected either on the south side or north side of the chip. Leave unconnected IF1 and IF2 ports open, that is, unconnected. See the Mounting and Bonding Techniques section for more information.

An external 90° hybrid is required to combine the quadrature outputs for downconversion or to split the IF input to quadrature inputs to the IF1 and IF2 pads for upconversion. See the Typical Application Circuit section for more information.

APPLICATIONS INFORMATION

TYPICAL APPLICATION CIRCUIT

Figure 86 shows the typical application circuit for the HMC521ACHIPS. The HMC521ACHIPS is a passive device and does not require any external components. The LO and RF pads are internally ac-coupled. The IFx pads are internally dc-coupled. For applications not requiring operation to dc, dc block these ports externally using a series capacitor of a value chosen to pass the necessary IF frequency range. When IF operation to dc is required, do not exceed the IFx source and sink current rating specified in the Absolute Maximum Ratings section.

To select the upper sideband when using the HMC521ACHIPS as an upconverter, connect the IF1 pad to the 90° port of the hybrid and connect the IF2 pad to the 0° port of the hybrid. To select the lower sideband, connect the IF1 pad to the 0° port of the hybrid and the IF2 pad to the 90° port of the hybrid. The input is from the sum port of the hybrid, and the difference port is 50 Ω terminated.

To select the upper sideband (low-side LO) when using as downconverter, connect the IF1 pad to the 0° port of the hybrid and connect the IF2 pad to the 90° port of the hybrid. To select the lower sideband (high-side LO), connect the IF1 pad to the 90° port of the hybrid and connect the IF2 pad to the 0° port of the hybrid. The output is from the sum port of the hybrid, and the difference port is 50 Ω terminated.

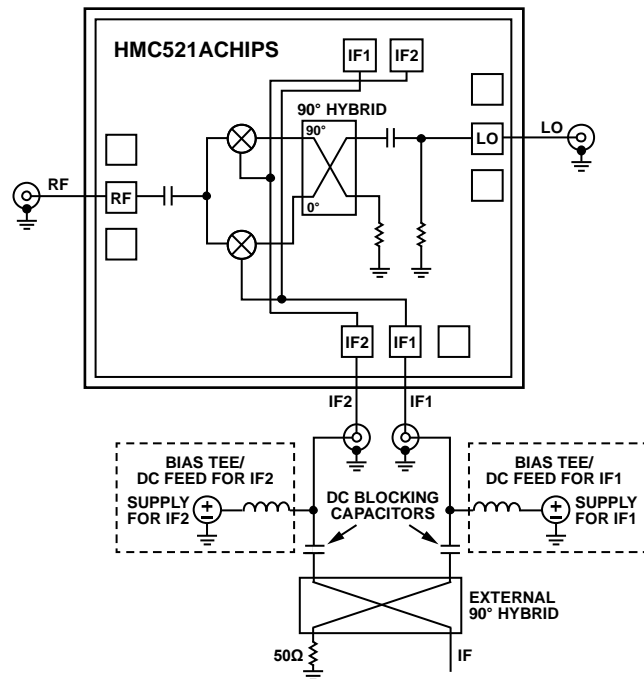

Figure 86. Typical Application

21137-086

MOUNTING AND BONDING TECHNIQUES

Attach the die directly to the ground plane eutectically or with conductive epoxy. To bring RF to and from the chip, 50 Ω microstrip transmission lines on 0.127 mm (0.005") thick alumina thin film substrates are recommended (see Figure 87). If using 0.254 mm (0.010") thick alumina thin film substrates, raise the die 0.150 mm (0.006") so that the surface of the die is coplanar with the surface of the substrate. A way to accomplish this is to attach the 0.102 mm (0.004") thick die to a 0.150 mm (0.006") thick molybdenum heat spreader (moly tab) which is then attached to the ground plane (see Figure 88). Place microstrip substrates as close to the die as possible to minimize bond wire length. Typical die to substrate spacing is 0.076 mm (0.003").

Figure 87. Bonding RF Pads to 5 mil Substrate

Figure 88. Bonding RF Pads to 10 mil Substrate

HANDLING PRECAUTIONS

Follow the precautions detailed in the Storage section, the Cleanliness section, the Static Sensitivity section, the Transients section, and the General Handling section to avoid permanent damage.

Storage

All bare dice are placed in either waffle- or gel-based ESD protective containers and then sealed in an ESD protective bag for shipment. Once the sealed ESD protective bag is open, store all dies in a dry nitrogen environment.

Cleanliness

Handle the chips in a clean environment. Do not attempt to clean the chip using liquid cleaning systems.

Static Sensitivity

Follow ESD precautions to protect against ESD strikes.

Transients

Suppress instrument and bias supply transients while bias is applied. Use shielded signal and bias cables to minimize inductive pickup.

General Handling

Handle the chip along the edges with a vacuum collet or with a sharp pair of bent tweezers. The surface of the chip has fragile air bridges and must not be touched with vacuum collet, tweezers, or fingers.

MOUNTING

The chip is back metallized and can be die mounted with gold (Au)/tin (Sn) eutectic preforms or with electrically conductive epoxy. The mounting surface must be clean and flat.

Eutectic Die Attach

A 80/20 gold and tin preform is recommended with a work surface temperature of 255°C and a tool temperature of 265°C. When hot 90/10 nitrogen(N)/hydrogen (H) gas is applied, the tool tip temperature must be 290°C. Do not expose the chip to a temperature greater than 320°C for more than 20 seconds. No more than 3 seconds of scrubbing is required for attachment.

Epoxy Die Attach

Apply a minimum amount of epoxy to the mounting surface so that a thin epoxy fillet is observed around the perimeter of the chip when the chip is placed into position. Cure epoxy per the schedule of the manufacturer.

WIRE BONDING

Ball or wedge bond with 0.025 mm (0.00098") diameter pure gold wire is recommended. Thermosonic wire bonding with a nominal stage temperature of 150°C and a ball bonding force of 40 grams to 50 grams or a wedge bonding force of 18 grams to 22 grams is recommended. Use the minimum level of ultrasonic energy to achieve reliable wire bonds. Wire bonds must start on the chip and terminate on the package or substrate. All bonds must be as short as possible <0.31 mm (0.01220").

ASSEMBLY DIAGRAM

The assembly diagram of the HMC521ACHIPS is shown in Figure 89.
