

# Full Function Load Switch with Adjustable Current Limit

## FPF2163, FPF2164, FPF2165

### General Description

The FPF2163, FPF2164, and FPF2165 is a series of load switches which provides full protection to systems and loads which may encounter large current conditions. These devices contain a 0.12 Ω current-limited P-channel MOSFET which can operate over an input voltage range of 1.8 – 5.5 V. Internally, current is prevented from flowing when the MOSFET is off and the output voltage is higher than the input voltage. Switch control is by a logic input (ON) capable of interfacing directly with low voltage control signals. Each part contains thermal shutdown protection which shuts off the switch to prevent damage to the part when a continuous over-current condition causes excessive heating.

When the switch current reaches the current limit, the parts operate in a constant-current mode to prohibit excessive currents from causing damage. For the FPF2163 and FPF2164, if the constant current condition still persists after 30 ms, these parts will shut off the switch and pull the fault signal pin (FLAGB) low. The FPF2163 has an auto-restart feature which will turn the switch on again after 450 ms if the ON pin is still active. The FPF2164 does not have this auto-restart feature so the switch will remain off until the ON pin is cycled. The FPF2165 will not turn off after a current limit fault, but will rather remain in the constant current mode indefinitely. The minimum current limit is 150 mA.

These parts are available in a space-saving 6 pin 2X2 MLP package.

### Features

- 1.8 to 5.5 V Input Voltage Range
- Controlled Turn-On
- 0.15 – 1.5 A Adjustable Current Limit
- Undervoltage Lockout
- Thermal Shutdown
- <2 μA Shutdown Current
- Auto Restart
- Fast Current Limit Response Time
  - ◆ 5 μs to Moderate Over Currents
  - ◆ 30 ns to Hard Shorts
- Fault Blanking
- Reverse Current Blocking
- RoHS Compliant
- These are Pb-Free Devices

### MARKING DIAGRAM

- &Z = Assembly Plant Code
- &2 = 2-Digit Date Code
- &K = 2-Digits Lot Run Traceability Code
- 16x = Device Code (x = 3, 4, 5)

### ORDERING INFORMATION

See detailed ordering and shipping information on page 12 of this data sheet.

### Applications

- PDAs
- Cell Phones
- GPS Devices
- MP3 Players
- Digital Cameras
- Peripheral Ports
- Hot Swap Supplies

## PIN CONFIGURATION

Figure 3. Pin Configuration

### PIN DESCRIPTION

Pin	Name	Function
1	ISET	Current Limit Set Input: A resistor from ISET to ground sets the current limit for the switch.
2	V <sub>IN</sub>	Supply Input: Input to the power switch and the supply voltage For the IC
3	V <sub>OUT</sub>	Switch Output: Output of the power switch
4	FLAGB	Fault Output: Active LO, open drain output which indicates an over current supply under voltage or over temperature state.
5, 7	GND	Ground
6	ON	ON Control Input

### ABSOLUTE MAXIMUM RATINGS

Parameter		Min	Max	Unit	
V <sub>IN</sub> , V <sub>OUT</sub> , ON, FLAGB, ISET to GND		-0.3	6	V	
Power Dissipation		-	1.2	W	
Operating and Storage Junction Temperature		-65	150	°C	
Thermal Resistance, Junction to Ambient		-	86	°C/W	
Electrostatic Discharge Protection	Jedec A114A	HBM	4000	-	V
	Jedec C101C	CDM	2000	-	V
	Jedec A115	MM	400	-	V
	IEC 61000-4-2	Air Discharge	15000	-	V
		Contact Discharge	8000	-	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

### RECOMMENDED OPERATING CONDITIONS

Parameter	Min	Max	Unit
V <sub>IN</sub>	1.8	5.5	V
Ambient Operating Temperature, T <sub>A</sub>	-40	85	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

## DESCRIPTION OF OPERATION

The FPF2163, FPF2164, and FPF2165 are current limited switches that protect systems and loads which can be damaged or disrupted by the application of high currents. The core of each device is a 0.12  $\Omega$  P-channel MOSFET and a controller capable of functioning over a wide input operating range of 1.8 – 5.5 V. The controller protects against system malfunctions through current limiting, undervoltage lockout and thermal shutdown. The current limit is adjustable from 150 mA to 1.5 A through the selection of an external resistor.

### On/Off Control

The ON pin controls the state of the switch. When ON is high, the switch is in the on state. Activating ON continuously holds the switch in the on state so long as there is no fault. For all versions, an undervoltage on  $V_{IN}$  or a junction temperature in excess of 140°C overrides the ON control to turn off the switch. In addition, excessive currents will cause the switch to turn off in the FPF2163 and FPF2164. The FPF2163 has an Auto-Restart feature which will automatically turn the switch on again after 450 ms. For the FPF2164, the ON pin must be toggled to turn-on the switch again. The FPF2165 does not turn off in response to an over current condition but instead remains operating in a constant current mode so long as ON is active and the thermal shutdown or undervoltage lockout have not activated.

The ON pin control voltage and  $V_{IN}$  pin have independent recommended operating ranges. The ON pin voltage can be driven by a voltage level higher than the input voltage.

### Fault Reporting

Upon the detection of an over-current, an input undervoltage, or an over-temperature condition, the FLAGB signals the fault mode by activating LO. For the FPF2163 and FPF2164, the FLAGB goes LO at the end of the blanking time while FLAGB goes LO immediately for the FPF2165. FLAGB remains LO through the Auto-Restart Time for the FPF2165. For the FPF2164, FLAGB is latched LO and ON must be toggled to release it. With the FPF2165, FLAGB is LO during the faults and immediately returns HI at the end of the fault condition. FLAGB is an open-drain MOSFET which requires a pull-up resistor between  $V_{IN}$  and FLAGB. During shutdown, the pull-down on FLAGB is disabled to reduce current draw from the supply.

### Current Limiting

The current limit ensures that the current through the switch doesn't exceed a maximum value while not limiting at less than a minimum value. The current at which the parts will limit is adjustable through the selection of an external

resistor connected to ISET. Information for selecting the resistor is found in the Application Info section. The FPF2163 and FPF2164 have a blanking time of 30 ms, nominally, during which the switch will act as a constant current source. At the end of the blanking time, the switch will be turned-off. The FPF2165 has no current limit blanking period so it will remain in a constant current state until the ON pin is deactivated or the thermal shutdown turns-off the switch.

For preventing the switch from large power dissipation during heavy load a short circuit detection feature is introduced. Short circuit condition is detected by observing the output voltage. The switch is put into short circuit current limiting mode if the switch is loaded with a heavy load. When the output voltage drops below  $V_{SCTH}$ , short circuit detection threshold voltage, the current limit value re-conditioned and short circuit current limit value is decreased to 62.5% of the current limit value. This keeps the power dissipation of the part below a certain limit even at dead short conditions at 5.5 V input voltage. The  $V_{SCTH}$  value is set to be 1 V. At around 1.1 V of output voltage the switch is removed from short circuit current limiting mode and the current limit is set to the current limit value.

### Undervoltage Lockout

The undervoltage lockout turns-off the switch if the input voltage drops below the undervoltage lockout threshold. With the ON pin active the input voltage rising above the undervoltage lockout threshold will cause a controlled turn-on of the switch which limits current over-shoots.

### Reverse Current Blocking

The entire FPF2163/65 family has a Reverse Current Blocking feature that protects input source against current flow from output to input. For a standard USB power design, this is an important feature which protects the USB host from being damaged due to reverse current flow on  $V_{BUS}$ . The reverse current blocking feature is active when the load switch is turned off.

If ON pin is LO and output voltage become greater than input voltage, no current can flow from the output to the input. The FLAGB operation is independent of the Reverse Current blocking feature and will not report a fault condition if this feature is activated.

### Thermal Shutdown

The thermal shutdown protects the die from internally or externally generated excessive temperatures. During an over-temperature condition the FLAGB is activated and the switch is turned-off. The switch automatically turns-on again if temperature of the die drops below the threshold temperature.

APPLICATION INFORMATION

Typical Application

Figure 25. Typical Application

Setting Current Limit

The FPF2163, FPF2164, and FPF2165 have a current limit which is set with an external resistor connected between ISET and GND. This resistor is selected by using the following equation,

$$R_{SET} = \frac{275.6}{I_{LIM}} \quad (\text{eq. 1})$$

$R_{SET}$  is in Ohms and that of  $I_{LIM}$  is Amps

The table below can also be used to select  $R_{SET}$ . A typical application would be the 500 mA current that is required by a single USB port. Using the table below an appropriate selection for the  $R_{SET}$  resistor would be 394 Ω. This will ensure that the port load could draw 525 mA, but not more than 875 mA. Likewise for a dual port system, an  $R_{SET}$  of 185 Ω would always deliver at least 1125 mA and never more than 1875 mA.

CURRENT LIMIT VARIOUS  $R_{SET}$  VALUES

$R_{SET}$ (Ω)	Min. Current Limit (mA)	Typ. Current Limit (mA)	Max. Current Limit (mA)
185	1125	1500	1875
220	938	1250	1562
275	750	1000	1250
306	675	900	1125
345	600	800	1000
394	525	700	875
460	450	600	750
550	375	500	625
610	338	450	563
690	300	400	500
790	263	350	438
920	225	300	375
1100	188	250	313
1380	150	200	250
1830	113	150	188

Input Capacitor

To limit the voltage drop on the input supply caused by transient in-rush currents when the switch is turned on into a discharged load capacitor or a short-circuit, a capacitor needs to be placed between  $V_{IN}$  and GND. A 4.7 µF ceramic capacitor,  $C_{IN}$ , must be placed close to the  $V_{IN}$  pin. A higher value of  $C_{IN}$  can be used to further reduce the voltage drop experienced as the switch is turned on into a large capacitive load.

Output Capacitor

A 0.1 µF capacitor  $C_{OUT}$ , should be placed between  $V_{OUT}$  and GND. This capacitor will prevent parasitic board inductances from forcing  $V_{OUT}$  below GND when the switch turns-off. For the FPF2163 and FPF2164, the total output capacitance needs to be kept below a maximum value,  $C_{OUT(max)}$ , to prevent the part from registering an over-current condition and turning-off the switch. The maximum output capacitance can be determined from the following formula,

$$C_{OUT(max)} = \frac{I_{LIM(max)} \times t_{BLANK(min)}}{V_{IN}} \quad (\text{eq. 2})$$

Power Dissipation

During normal operation as a switch, the power dissipated in the part will depend upon the level at which the current limit is set. The maximum allowed setting for the current limit is 1.5 A and this will result in a power dissipation of,

$$P = (I_{LIM})^2 \times R_{DS} = (1.5)^2 \times 0.12 = 270 \text{ mW} \quad (\text{eq. 3})$$

If the part goes into current limit the maximum power dissipation will occur when the output is shorted to ground. For the FPF2163, the power dissipation will scale by the Auto-Restart Time,  $t_{RSTRT}$ , and the Over Current Blanking Time,  $t_{BLANK}$ , so that the maximum power dissipated is,

$$P(max) = \frac{t_{BLANK}}{t_{BLANK} + t_{RSTRT}} \times V_{IN(max)} \times I_{LIM(max)}$$

$$= \frac{30}{30 + 450} \times 5.5 \times 1.5 = 515.6 \text{ mW} \quad (\text{eq. 4})$$

## FPF2163, FPF2164, FPF2165

This is more power than the package can dissipate, but the thermal shutdown of the part will activate to protect the part from damage due to excessive heating. When using the FPF2164, attention must be given to the manual resetting of the part. The junction temperature will only be able to increase to the thermal shutdown threshold. Once this temperature has been reached, toggling ON will not turn-on the switch until the junction temperature drops. For the FPF2165, a short on the output will cause the part to operate in a constant current state dissipating a worst case power of,

$$\begin{aligned}
 P(\text{max}) &= V_{\text{IN}}(\text{max}) \times I_{\text{LIM}}(\text{max}) \\
 &= 5.5 \times 1.5 = 8.25 \text{ W}
 \end{aligned}
 \tag{eq. 5}$$

This large amount of power will activate the thermal shutdown and the part will cycle in and out of thermal shutdown so long as the ON pin is active and the short is present.

### Board Layout

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for  $V_{\text{IN}}$ ,  $V_{\text{OUT}}$  and GND will help minimize parasitic electrical effects along with minimizing the case to ambient thermal impedance.

The middle pad (pin 7) should be connected to the GND plate of PCB for improving thermal performance of the load switch. An improper layout could result higher junction temperature and triggering the thermal shutdown protection feature. This concern applies when the switch is set at higher current limit value and an overcurrent condition occurs. In this case power dissipation of the switch ( $P_{\text{D}} = (V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{LIM}}(\text{max})$ ) could exceed the maximum absolute power dissipation of 1.2 W.
