Description

The ESDLIN1524BJ is an asymmetrical TVS diode designed to protect one local interconnect network (LIN) bus and clock extension peripheral interface (CXPI) against electrostatic discharge (ESD) and other transient surges such as those defined in ISO 7637-3.

The SOD323 is a small package that saves space on high density printed circuit board.

2. *To calculate V_{BR} or V_{CL} versus junction temperature, use the following formulas:*
   - *V_{BR} at T_J = V_{BR} at 25 °C x (1 + αT x (T_J - 25))*
   - *V_{CL} at T_J = V_{CL} at 25 °C x (1 + αT x (T_J - 25)).*

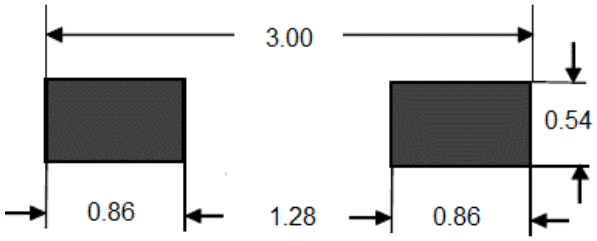
3 Recommendations on PCB assembly

3.1 Footprint

Figure 22. **Recommended footprint in mm**

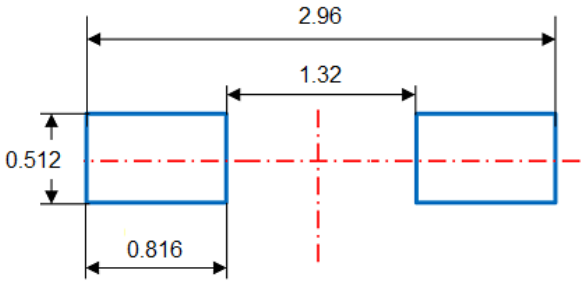


3.2 Stencil opening design

Stencil opening thickness: 75 to 125 µm / 3 to 5 mils

Pad stencil aperture ratio: 90%

Figure 23. **Stencil opening recommendations**



3.3 Solder paste

1. Halide-free flux, qualification ROL0 according to ANSI/J-STD-004.
2. “No clean” solder paste recommended.
3. Offers a high tack force to resist component movement during high speed.
4. Use solder paste with fine particles: powder particle size is 20-38 µm.

3.4 Placement

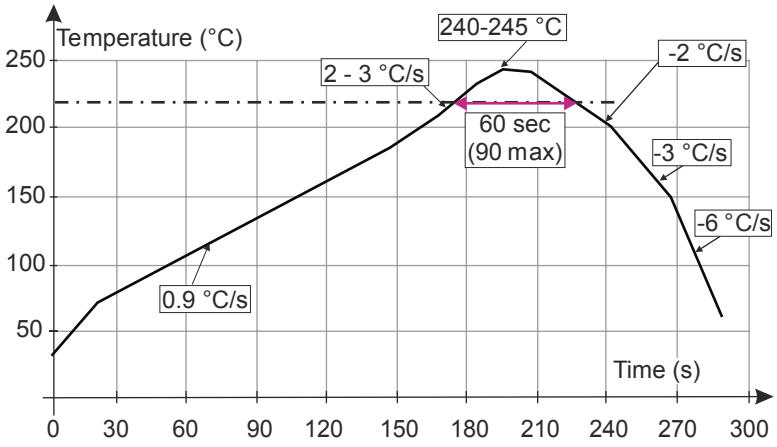
1. Manual positioning is not recommended.
2. It is recommended to use the lead recognition capabilities of the placement system, not the outline centering.
3. Standard tolerance of ±0.05 mm is recommended.
4. 1.0 N placement force is recommended. Too much placement force can lead to squeezed out solder paste and cause solder joints to short. Too low placement force can lead to insufficient contact between package and solder paste that could cause open solder joints or badly centered packages.
5. To improve the package placement accuracy, a bottom side optical control should be performed with a high resolution tool.
6. For assembly, a perfect supporting of the PCB (all the more on flexible PCB) is recommended during solder paste printing, pick and place and reflow soldering by using optimized tools.

3.5 PCB design preference

1. To control the solder paste amount, the closed via is recommended instead of open vias.
2. The position of tracks and open vias in the solder area should be well balanced. A symmetrical layout is paste printing, pick and place and reflow soldering by using optimized tools.

3.6 Reflow profile

Figure 24. ST ECOPACK recommended soldering reflow profile for PCB mounting



Note: Minimize air convection currents in the reflow oven to avoid component movement. O_2 rate inside the oven must be below 500 ppm. Maximum soldering profile corresponds to the latest IPC/JEDEC J-STD-020.
